

Focus Apps

Focus Friend

Companion attachment + room customisation

Source: focusfriendapp.pdf

Monthly iOS revenue estimate: ~\$150K USD | Captured onboarding states: 14

14 initial narrative/setup states; source pages 2-15.

ScreensDesign; current page title labels revenue per month. Exact geographic scope and reporting month not disclosed.

1. Onboarding

Story-based introduction: meet and name the Bean, learn that it knits while you focus and gets distracted when you use your phone. Knitted items can be exchanged for room decorations. Premium decorations are mentioned before entering the room. No mandatory account creation appears in the captured flow.

2. When does it ask for money?

Onboarding mentions Pro, but the captured flow permits a focus session before the actual purchase screen. The paywall is inside Shop > Pro. Other Bean appearances are sold separately.

3. Offer on the paywall

Plans display 399/month, 1,999/year and 3,999 lifetime. The currency symbol renders incorrectly, although the annual option explicitly states INR. Annual is highlighted with 58% off and INR 166.58/month. Pro includes sessions up to six hours, scarves for premium decorations, optional 3x sock rewards and an allow list for selected apps during Deep Focus. No free trial is displayed. Separate Bean purchases show prices such as 499 and 599.

4. What is available for free?

Basic Bean companion and focus timer; a 15-minute session is shown running. The basic sock-based reward and decoration loop is explained. Room editor, Bean naming and focus statistics screen are accessible. Premium scarves, reward multiplier, longer sessions and the app allow list are advertised as Pro benefits.

5. Proof of concept / reason to buy

Demonstration: users see the Bean actively knitting during a real timer session. Purchase motivation: attachment to the companion, decorating its room, faster rewards and longer sessions. The capture shows a running session, but not a completed session earning and spending rewards.

Finch

Personalised pet + self-care routines

Source: finchapp.pdf

Monthly iOS revenue estimate: ~\$1M USD | Captured onboarding states: 32

27 initial setup states (pages 1-3, 5-20, 22-28, 30), plus 5 post-offer setup states (35-39).

Sensor Tower indexed listing: worldwide iOS, last month; calendar month not exposed. ScreensDesign app page also reports \$1M/month.

1. Onboarding

Choose an egg, hatch a bird, select pronouns, name it and choose a personality trait. Account creation has a Skip option. A lengthy questionnaire covers sleep, activity, stress, routines, support needs and procrastination. A starter self-care plan is generated before the paid trial offer. Streaks, a commitment goal and a home-screen widget are introduced later.

2. When does it ask for money?

First after generating the starter plan, before normal dashboard use. Additional Plus prompts appear in the shop and settings. The offer can be skipped; later settings show Finch Plus: None, supporting that subsequent dashboard access is free.

3. Offer on the paywall

Initially promotes seven days free, followed by a one-time offer for 14 days free, then ₹3,499/year. That initial offer contains inconsistent crossed-out pricing and discount text, so its claimed discount cannot be reconciled. A later paywall offers ₹399/year against ₹1,188, with seven days free, or ₹99/month with three days free. The Apple purchase sheet confirms one week free, then ₹399/year for the later annual offer. Benefits include unlimited exercises, custom emojis, double rewards and daily shop deals. Both Free and Plus are shown as ad-free.

4. What is available for free?

Pet creation, basic companion experience, daily goals, starter plan, streaks, quests and adventure progression. Basic outfit/furniture shopping with earned currency, friends, pet profile, goal history and basic insights screens are accessible. The activities menu is available, but the capture does not establish the free limits of every exercise. Unlimited exercises and several customisation/reward benefits are reserved for Plus.

5. Proof of concept / reason to buy

Demonstration: a personalised pet and practical starter goals create an immediate connection.

Purchase motivation: more activities, faster rewards, customisation and continued engagement with the pet. The paywall claims Plus users are 2x better at sticking to goals; this is app marketing, not independently demonstrated in the PDF. The first paywall arrives before users complete a meaningful self-care routine.

Flora

Earned focus currency + additional tours

Source: floraapp.pdf

Monthly iOS revenue estimate: ~\$32K USD | Captured onboarding states: 3

2 authentication states (pages 2-3), plus 1 home-screen tutorial (4).

Peekaso App Store keyword comparison; monthly estimate. Geographic scope and calendar month not disclosed.

1. Onboarding

Login/signup through Google, Apple or email. No guest option is visible in the captured login screens. Contextual instructions explain tasks, focus sessions, virtual trees and tours. One successfully focused minute earns one Bit, used to unlock seeds.

2. When does it ask for money?

No subscription paywall interrupts the captured onboarding. Purchase offers appear while exploring additional Tours. Settings include Flora Care, described as planting real trees when reaching goals, but its purchase terms are not opened.

3. Offer on the paywall

Drylands' Marvels: ₹199. Amazon Rainforest: ₹199. Each tour advertises 12 locations/stops and 36 plants. These appear as individual tour purchases with Buy Now, rather than a recurring subscription. No trial or discount is shown.

4. What is available for free?

Basic focus and break timer; a 25-minute focus / five-minute break setup is shown. Basic virtual planting and earned Bits, tasks, reminders, goals, daily/weekly statistics, friends and QR connections are accessible. Initial tour/garden access is available; additional seeds can require earned Bits. A lock caused by insufficient Bits is not automatically a cash paywall.

5. Proof of concept / reason to buy

Demonstration: users can start a focus session and see the garden experience before buying a tour. Purchase motivation: extra scenery, plant collections and exploration. The paid offer expands the experience instead of making the basic timer depend on a subscription. The capture does not show a completed session or purchased tour.

Focus Plant

Focus time → raindrops → plant growth

Source: focusplantapp.pdf

Monthly iOS revenue estimate: <5K USD | Captured onboarding states: 21

10 initial questionnaire/report/commitment states (pages 3-12), plus 11 first-session/planting tutorial states (14-15, 17-25). Page 16 repeats page 15.

Peekaso shows approximately \$2K; formatted as <5K as requested. App Store estimate; geographic scope and calendar month not disclosed.

1. Onboarding

Asks whether focus is needed for work, study or another purpose, then asks about daily phone use and requests Screen Time access. Presents phone-use reduction projections and a commitment statement. Shows the trial offer, then a five-second demonstration session. Teaches the complete loop: focus, earn raindrops, plant, water and grow.

2. When does it ask for money?

First at the end of the questionnaire, before the first practical focus demonstration. A second special offer appears after the planting tutorial.

3. Offer on the paywall

Initial offer: seven days free, then ₹759/year (₹63.25/month equivalent). Includes a trial-reminder option and no payment required today messaging. Follow-up offer: 25% off, reducing annual pricing to ₹569/year, with seven days free. Says the special offer disappears on closing the window. Advertises full premium access without a complete feature-by-feature premium list.

4. What is available for free?

The flow continues past the closable offer into the demonstration. Basic countdown session, raindrop rewards, planting and watering are shown. A later five-minute session can also be started. History and timer-help screens are accessible. Some game tabs have locks during the tutorial; the screenshots do not establish whether each requires payment or gameplay progression. App-blocking options appear, but their full free entitlement is not established.

5. Proof of concept / reason to buy

Demonstration: the user completes a short session, receives a reward and uses it to grow a plant. This is the most explicit practical reward tutorial among these captures. Purchase motivation: garden progression and the promise of reclaiming time. The first paywall precedes this demonstration. Reduction percentages are promotional projections, not the user's measured improvement.

Focus Traveller

An illustrated journey while focusing

Source: focusTraveller.pdf

Monthly iOS revenue estimate: ~\$5K USD | Captured onboarding states: 8

3 initial introduction/permission/selection states (pages 1-3), plus 5 initial guided-use states (4-6, 10-11). Pages 7 and 9 repeat the journey panel.

Peekly headline and FAQ report \$5K/month; App Store listing. Exact geographic scope and calendar month not disclosed. Gated metric placeholders are not used.

1. Onboarding

Introduces the travel setting and traveller selection. Includes a permission prompt with a Later option. Contextual instructions explain solo/group travel, focus and rest modes. Users enter a journey and see their traveller in the environment.

2. When does it ask for money?

Become Pro Traveller appears during initial feature exploration, before the captured running focus session. It has a close button. Settings also contain a Pro upgrade entry.

3. Offer on the paywall

₹99/month recurring; ₹799/year, recommended, with a three-day free trial; or ₹1,499 lifetime with no recurring payments. Main promise: Get All Features. The visible pricing section does not clearly enumerate all free-versus-Pro differences.

4. What is available for free?

Basic traveller selection and solo focus journey. Focus/rest experience is shown after dismissing the paywall. Profile, journey log, statistics, ranking and achievement screens are accessible. A group-creation entry is visible, but a completed free group session is not demonstrated. Full character/theme availability cannot be established from the capture.

5. Proof of concept / reason to buy

Demonstration: users see the travelling character and focus/rest environments in action. Purchase motivation: immersion and access to the full experience. The phrase all features is less specific than showing precisely what upgrading adds.

Forest

Grow a forest + unlock productivity tools

Source: forest.pdf

Monthly iOS revenue estimate: ~\$100K USD | Captured onboarding states: 9

8 initial setup/demo/account states (pages 2-9), plus 1 welcome-gift instruction (15).

Sensor Tower indexed listing: worldwide iOS, last month; calendar month not exposed. Other providers differ; this is not a uniform same-month ranking.

1. Onboarding

Asks what distracts the user, explains blocking and requests Screen Time access. Shows a brief tree/timer demonstration and asks about reminders. Introduces focus habits and forest growth, then account creation and Plus. Later provides a Monstera welcome gift and encourages a ten-minute session.

2. When does it ask for money?

First during onboarding, after the brief demonstration but before a meaningful full session. Later prompts appear for 3x rewards, premium plants, detailed insights, real-tree planting and settings.

3. Offer on the paywall

Seven days free, then ₹1,299/year. Presented as 48% off ₹2,499 and ₹108.25/month equivalent, billed annually. Promises a reminder two days before trial expiry. Plus includes custom app allow list, performance insights, custom focus experience, seasonal crystal trees, 3x coins, real-tree planting and an ad-free experience. Separate crystal packs range from ₹99 to ₹2,299.

4. What is available for free?

The comparison explicitly includes the focus timer in Free. Basic trees, planting, tags, forest overview and timeline are accessible. Later settings label the account Free. Premium plants and detailed insights are advertised as upgrades. Custom app allow list and real-tree planting are explicitly Plus benefits.

5. Proof of concept / reason to buy

Demonstration: a growing tree makes focused time tangible; the user starts a ten-minute session.

Purchase motivation: a richer forest, faster unlocks and understanding focus habits. The paywall claims eight million users paid to upgrade; this is social proof presented by the app. The capture does not show a completed session or measured improvement.

Study Bunny

Study rewards + optional purchase bundles

Source: studybunny.pdf

Monthly iOS revenue estimate: ~\$7K USD | Captured onboarding states: 7

5 guided introduction/session/reward/shop states (pages 2, 4-7), plus 2 naming/Happy Meter states (13-14). Peekaso App Store keyword comparison; monthly estimate. Geographic scope and calendar month not disclosed. Advertising revenue is not established.

1. Onboarding

Starts with notification permission, introduces the bunny and guides menu/timer use. Requests tracking permission for personalised ads. Demonstrates a 30-minute session and coin reward. Later introduces naming and the Happy Meter. Login appears later instead of blocking initial timer access.

2. When does it ask for money?

No compulsory subscription paywall appears during onboarding. Paid options are in the In-app purchases panel. Ads appear during normal use; rewarded ads provide extra currency.

3. Offer on the purchase screen

\$0.99: one Gold Crown, activated for 30 days of no ads, offline use and a wearable crown. \$1.99: 100 coins + 100 carrots. \$4.99: 250 coins + 250 carrots, monthly skin and premium cloud save/load. \$14.99: 250 coins + 250 carrots, lifetime no ads/offline use and premium cloud save/load. \$19.99: larger currency bundle, skin, additional lifetime perks and exclusive study buddy. \$69.99: 2,000 coins + 2,000 carrots, all 12 exclusive month skins, all 12 exclusive study buddies and lifetime perks. These are purchase bundles; no recurring subscription is displayed.

4. What is available for free?

Basic study timer, earned coins, bunny naming, Happy Meter, study tracker, tasks, flashcards, daily check-in and study tips. Store items can be bought with earned virtual currency. Rewarded ads offer more coins/carrots with displayed daily limits. Normal use is ad-supported.

5. Proof of concept / reason to buy

Demonstration: the tutorial shows 30 study minutes producing three coins, then introduces items those coins can buy. Purchase motivation: remove ads, use offline, obtain premium cosmetics and accelerate rewards. Paid benefits are concrete while basic study tools remain free.

Comparative assessment

App	Main paid motivation	Value before first offer
Focus Friend	Companion customisation; faster rewards	Running timer and knitting
Finch	More exercises, rewards and customisation	Pet creation and starter plan
Flora	Additional tours and plants	Basic garden/focus experience
Focus Plant	Premium access and garden progression	Questionnaire/projections; demo follows
Focus Traveller	Full travel experience	Traveller selection and introduction
Forest	More trees, insights and controls	Brief tree/timer demonstration
Study Bunny	No ads, offline use, cosmetics and bundles	Tutorial session and coin reward

Most explicit reward demonstration

Focus Plant completes the tutorial loop: focus, receive raindrops and grow a plant. Its first paid offer arrives before that practical demonstration.

Strong companion-led motivation

Focus Friend connects focused time to the Bean's knitting and room decorations. Its shop upgrade builds on a visible companion experience.

Clearest free-versus-paid comparison

Forest explicitly compares Free and Plus. The basic timer remains free while insights, custom app allow list and real-tree planting are advertised as paid benefits.

Concrete optional purchase benefits

Study Bunny offers no ads, offline use, currency and cosmetics through purchase bundles. A subscription is not shown.

Important pricing distinction

Finch displays two substantially different annual offers. Both are preserved as captured; the screenshots do not explain the difference. Flora's captured purchase offers sell tours, not a recurring subscription.

Revenue & onboarding overview

Revenue values are USD monthly estimates associated with iOS/App Store listings. They are not US-only revenue, profit, or a verified same-month ranking. Exact reporting months are unavailable in several public sources. Values below \$5,000 are written as <5K; exactly \$5K remains \$5K.

Counting method

Counts describe distinct captured initial setup and guided first-use states, not the number of taps or the total PDF pages. Include welcome, authentication, questionnaire, narrative, instructional demo and first-use tutorial states. Exclude payment offers, native-only permission dialogs, splash/loading-only screens, repeated captures, pure animation frames and later optional feature help. Permission-explanation screens made by the app are included. The split and page references on each app page make the counts auditable. Different selections may produce different paths; these are not guaranteed exhaustive app-wide counts.

App	Monthly revenue (USD)	Onboarding states
Focus Friend	~\$150K	14
Finch	~\$1M	32
Flora	~\$32K	3
Focus Plant	<5K	21
Focus Traveller	~\$5K	8
Forest	~\$100K	9
Study Bunny	~\$7K	7
